VETERINARY RADIOLOGICAL SYSTEM

MED VET is a modern and functional X-ray system, designed to satisfy the needs and the requirements of any veterinary clinic.
The tabletop, designed for a patient weight up to 150 kg, makes the system suitable for small and medium size animals.
The compact, lightweight and innovative design, combined with cutting-edge performances and user friendly components, offers a turn-key solution.

MED VET analogic configurations are CR and DR compatible. Any CR configuration can be easily upgraded to a DR configuration after installation. A fully integrated DR system, with different detectors, is available.

X-RAY TABLE

The X-ray table is provided with a low absorption laminated tabletop, four way floating, ensuring silent and smooth mechanical movements, reducing animal stress during a typical study.
The tabletop is available in two different sizes, for installation in any room and is designed for an easy and quick cleaning after use.
The aluminium profiles are prepared for mounting dedicated accessories, such as compression bands, handles and fixing clamps for holding ties.

GENERATOR AND MONOBLOCK

The system is equipped with a powerful single phase high frequency generator, integrated directly inside the X-ray table. Thanks to the pre-programmed APR, the generator is easy and intuitive to use in any condition. All the generator controls are comfortably located on the 8" LCD touch screen, for the benefit of both patient and operator in any X-ray investigation procedure.
All the configurations are provided with a high performance, advanced monoblock, which incorporates the X-ray components and the high voltage parts in a single tank.
The system can be operated either at 230 Vac or 110 Vac (optional), frequency 50 or 60 Hz.

COLUMN STAND

The column stand is compact and ensures an easy and fast installation. It is equipped with state-of-the-art 8" (eight inches) colour LCD touch screen display, integrated in the monoblock cover.
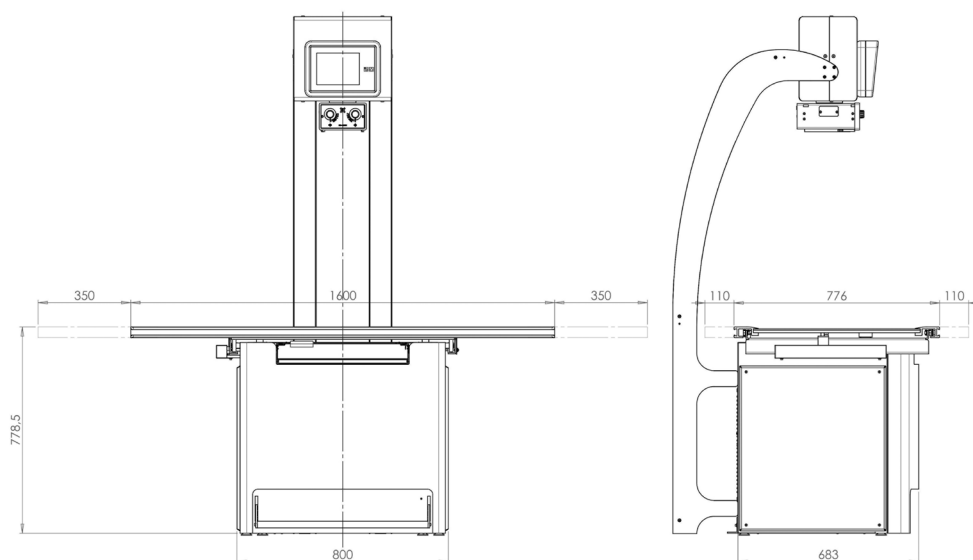

COLLIMATOR

The collimator integrated in the system is provided with a LED light that can be activated from the generator console when pressing the brake pedal and during the preparation phase. Collimator rotation improves the whole examination process, avoiding animal re-positioning.
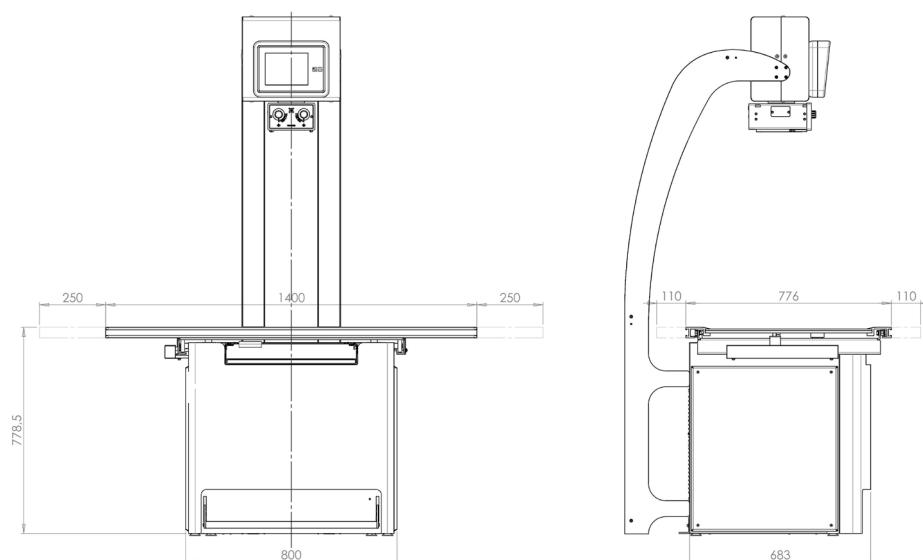

OPTIONS

The system can be provided with several dedicated accessories, such as compression bands, handles, fixing clamps for holding ties. Removable grids, for perfect image quality, are also available.
On request, the system can be supplied with a second X-ray activation tool (footswitch / handswitch) to make X-ray exposures in different positions, thus facilitating any examination procedure.
